

4th SSN LRIT Group Meeting

Web services with IMO/GISIS

Agenda item 4.6.2

Marta Lima / Senior project Officer
Department C: Operations / Unit C.2.1

Lisbon / 23 October 2018

Background

- IMO (in cooperation with Norway) is developing web-services for Contracting Governments to upload information to the GISIS module for Maritime Security (ISPS code)
- Some Member States and organizations have suggested to IMO that bulk data retrieval methods be added to the data exchange facility
- IMO is requesting indications if more Contracting Governments are interested in such a facility, which could then be added to the specifications

Proposal

- EMSA proposes to establish a link between GISIS and the Central Locations Database (CLD) to ensure full synchronisation of the Port Facilities codes
- This information can then be made available to national SSN system using the CLD webservices already in place

Action required

- MS to support the request to IMO to further develop the data exchange facility to add the possibility to retrieve information
