

# LRIT reporting status

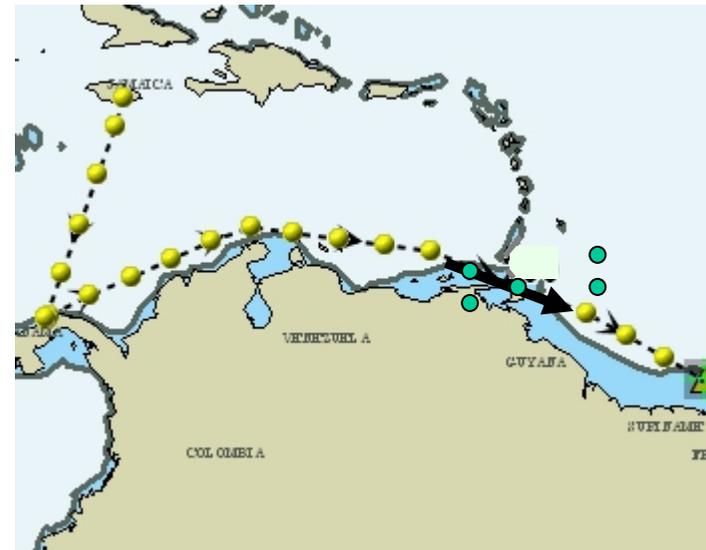

# Not integrated

- Incorrect Radio ID in EU Ship DB
- Missing Information for integration (No Radio ID and No ASP Name)
- DNID downloading protocol failed  
(no typical reasons found yet)

# Overreporting / stored reports

- Tx of stored messages
- memcode 70
- not regarded as „overreporting“ any more
- ship will not be „stopped“
- no processingn of data

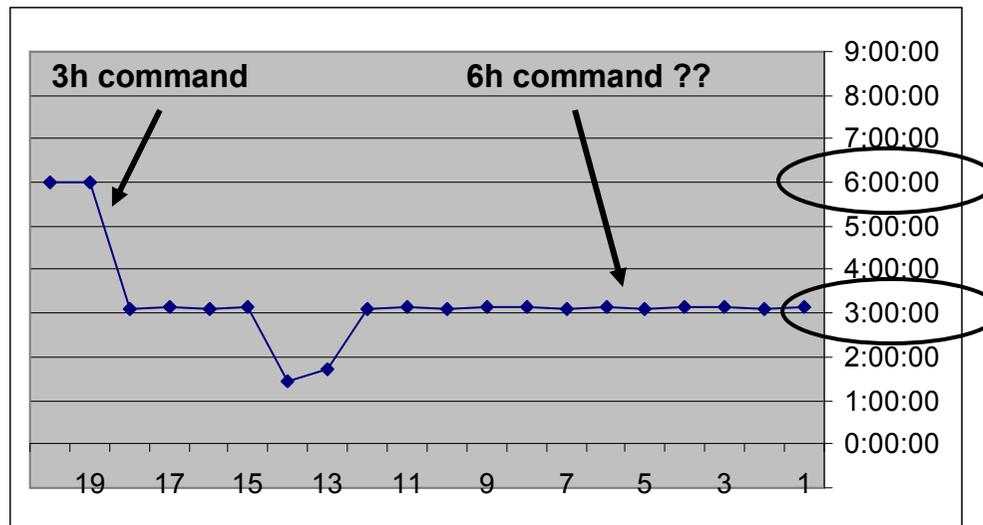

- Standard report (memcode11)
- Stored report (memcode70)

# Overreporting / SSAS

- Can occur with combined LRIT / SSAS terminals
- when SSAS button is pressed,
  - SSAS messaging starts (required function)
  - SSAS position reporting starts (SSAS optional)
- depending on configuration SSAS reports are not clearly independent of LRIT reports
- high number of reports (memcode93) received by ASP / LRIT-reporting of ship will be „stopped“

# Overreporting / no rx

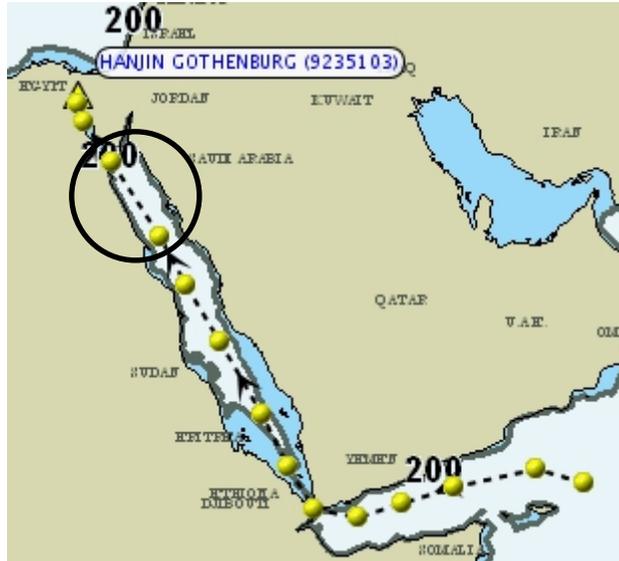

- After being programmed to report at higher rate, the 6h command fails (memcode 11 overreporting)
- this can be due to radio problems and should be retried 3 times (as in circ.1307)

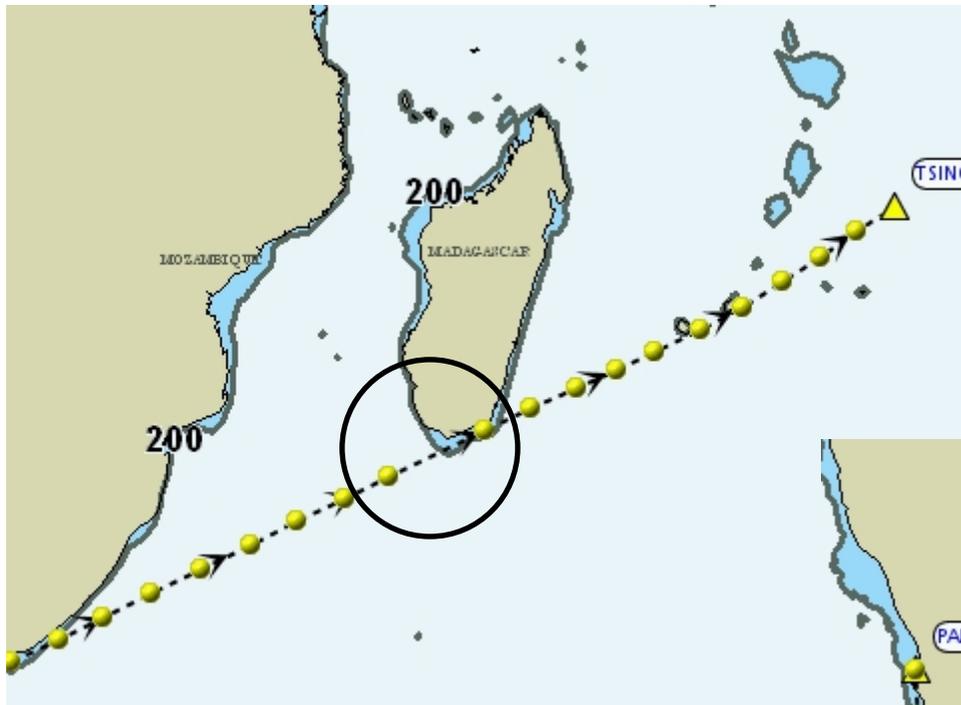

# Not reporting

- Ships not reporting show a specific pattern
  - some reps missing or unsteady reporting
  - suddenly stop reporting without coming back
- all types of terminals affected, all ASP's
- groups of ships stop on same dates (6.10.)
- possible reasons:
  - switch off / log out
  - interference with other applications (EGC, mailing)
  - ocean region transfer problems

# Not reporting

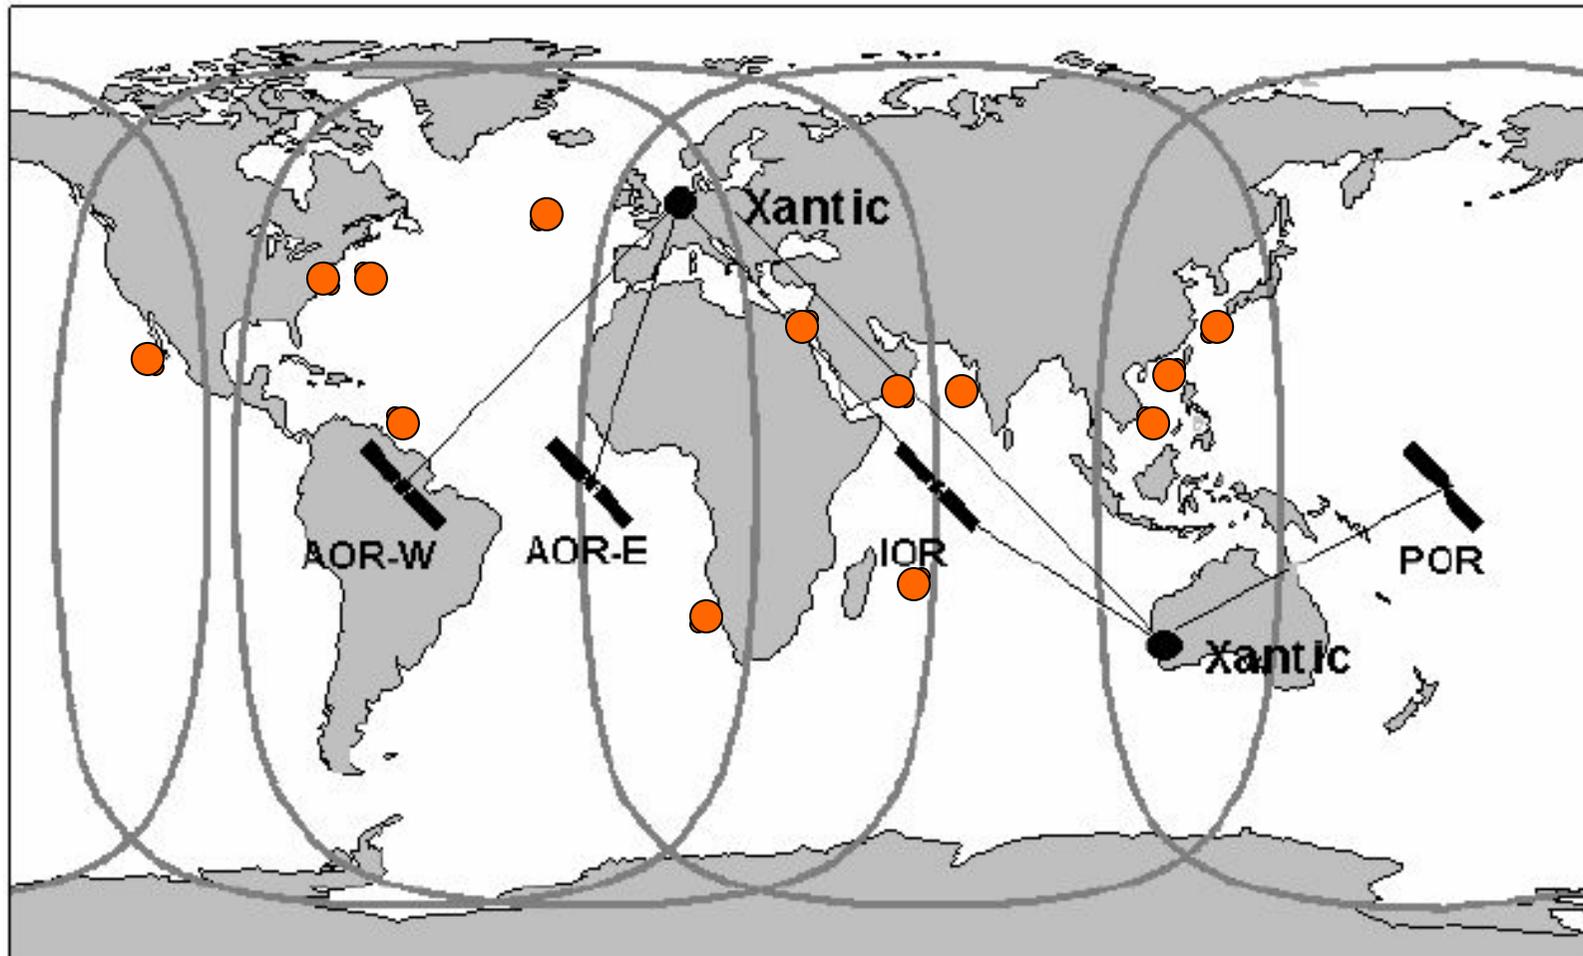

# Not reporting

# Not reporting

- Ships not reporting show a specific pattern
  - some reps missing or unsteady reporting
  - suddenly stop reporting without coming back
- all types of terminals affected, all test-ASP's
- groups of ships stop on same dates (6.10.)
- possible reasons:
  - switch off / log out (?)
  - interference with other applications (EGC, mailing)
  - ocean region transfer or LES/ASP problems

# Not reporting / OR-issue?

● Last known positions

# Actions taken

- Integration problems:
  - check with shipowner and update DB
- Overreporting (upon agreement with EMSA):
  - stored messages: no action (memcode 70)
  - other reasons: specific evaluation with shipowner and manufacturer, config update (memcode 93)
- Underreporting:
  - evaluate data as available from EMSA
  - check with manufacturer and shipowner, retest

# Suggestions

- We do need full support of EMSA and CLS to evaluate reporting errors
  - logfile, memcode, commands sent
- Underreporting:
  - INMARSAT support (logs)
  - more (older) data be accessible
- stored messages should be processed
- Flag-access to all data available in DC
